Adobe put the "portable" in Portable Document Format, and now DocsCorp has announced its pdfDocs formFiller, an application that integrates with Enterprise CMS solutions such as Hummingbird (Open Text), Interwoven, TRIM Context, and Worldox. Out of the box the tool gives users the ability to fill-in, edit, save, digitally sign and forward PDF forms as part of a business process workflow.

The company and its products serve to facilitate PDF documents within the content services document workflow. Data contained within the form can be exported as FDF or XFDF data files, which can then be archived or imported into other PDF forms. Unlike other PDF form solutions, pdfDocs formFiller enables you to type data directly into the form, save it and continue to edit or complete later.

Customers get portability plus integration. pdfDocs formFiller is part of the company's pdfDocs Solutions Suite of products which recently added expanded integration with the Worldox document management system. The product also integrates with MS Office, scanners, MFDs, and leading document and records management systems.
